TRIMS

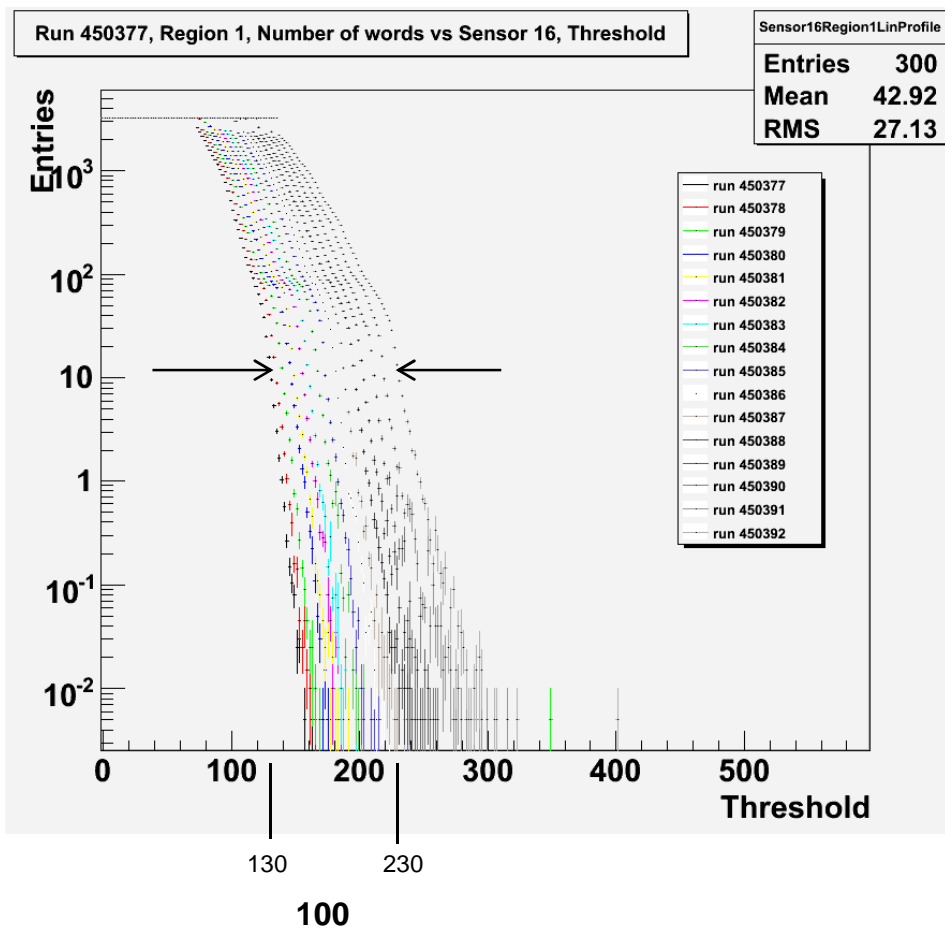

- Were looking odd.....
- Step size too large!
- Tested some new values...
 - R73=180k
 - R75=180k
- Need to check this covers pixel spread!
(TBD)

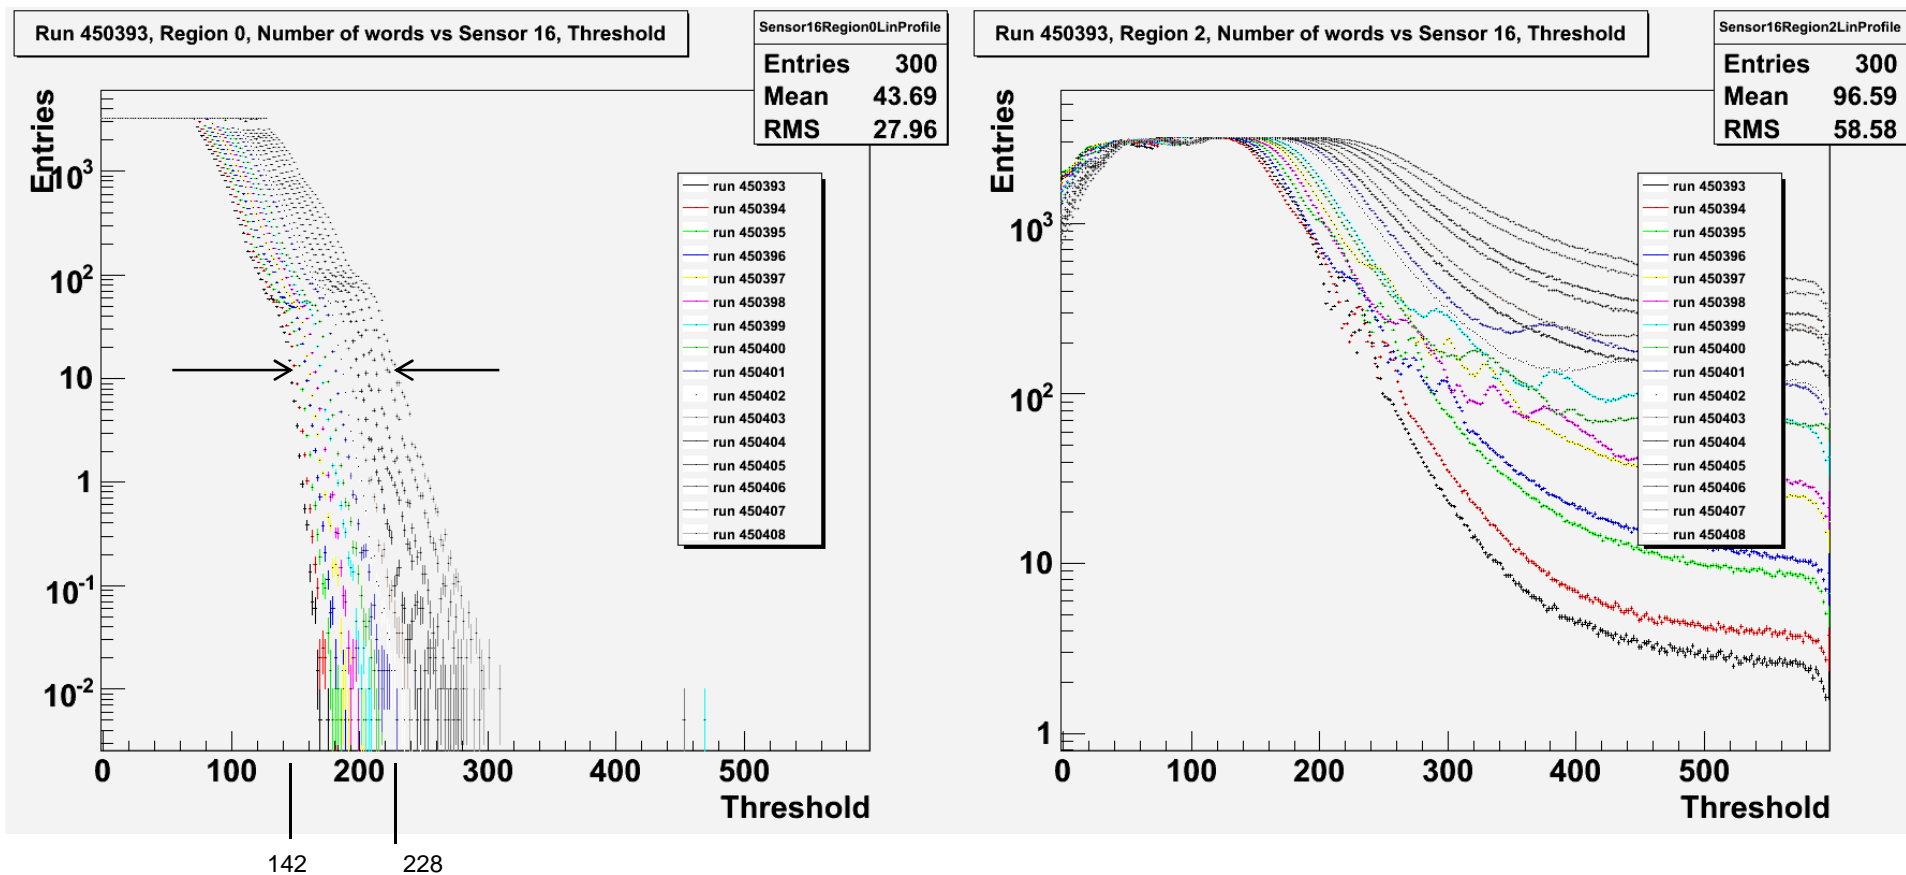

TRIMS 0à 15 DAC_(8,11)=3000

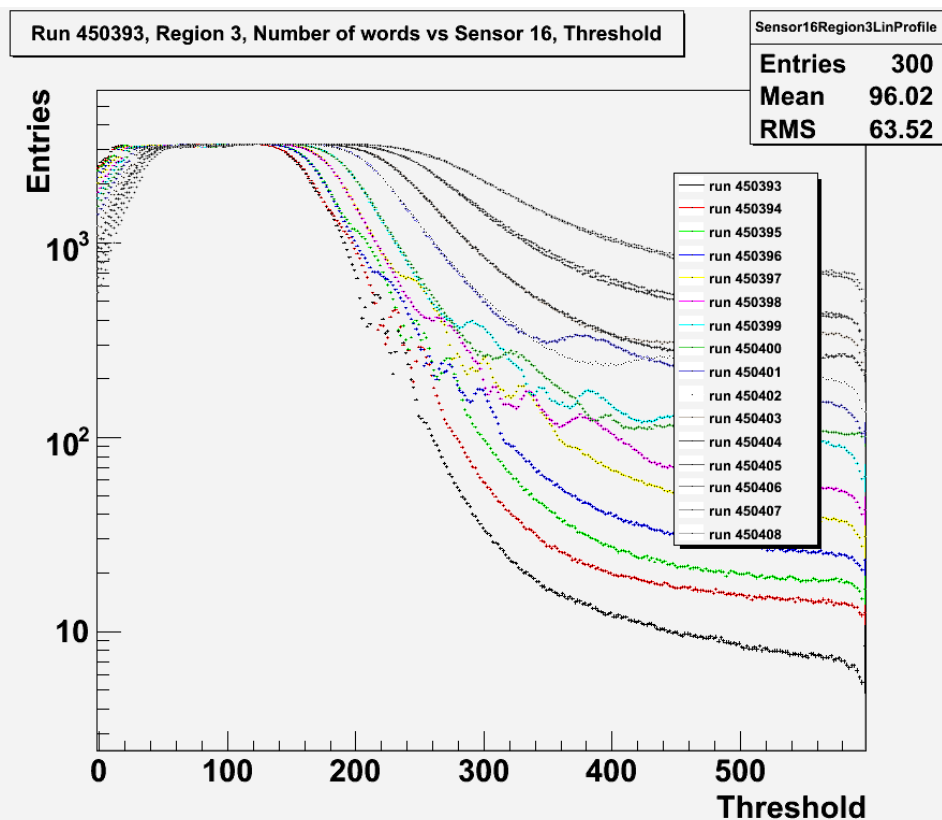

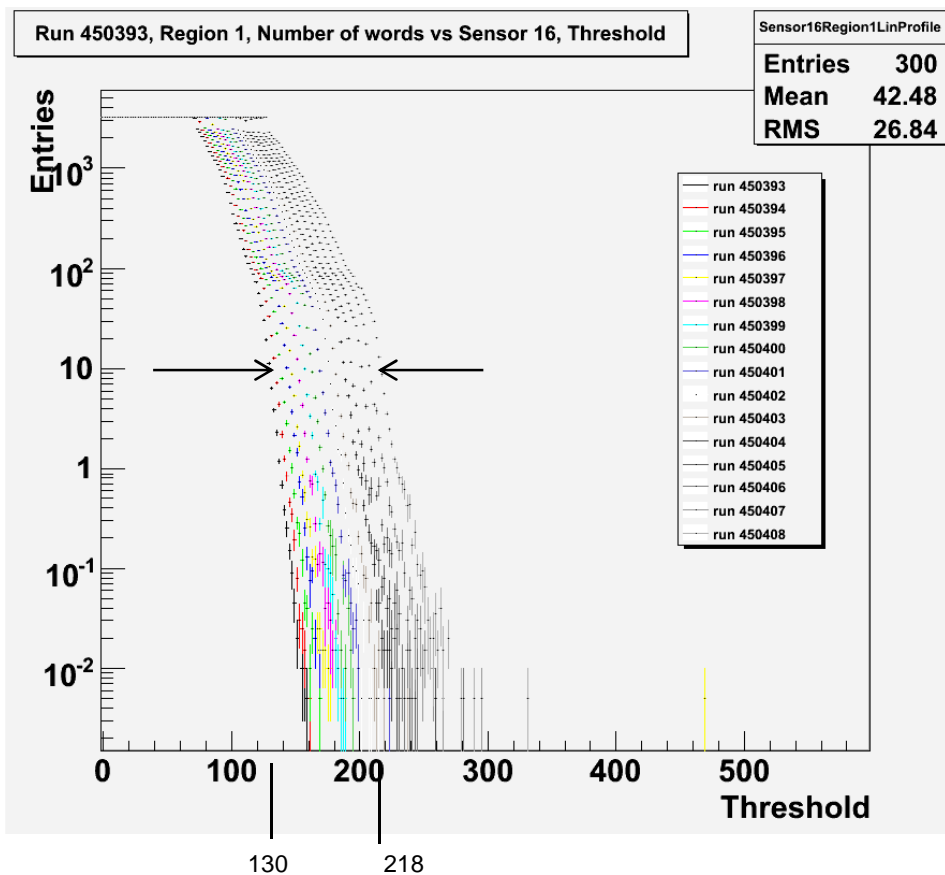

TRIMS 0à 15 $DAC_{(8,11)}=30000$

TRIMS 0à 15 $DAC_{(8,11)}=1000$

TRIMS 0à 15 $DAC_{(8,11)}=1000$

Cold Columns?

- Marcel reported uneven distribution of noise hits in different regions of the shapers à
- Explanation:
 - Effect seen only at very low threshold levels
 - Sensor is therefore seeing hits in ~all pixels (~override mode)
 - Therefore memories fill sequentially
 - Not enough memory to store three full rows of hits, hence “cold columns”
 - Hits are stored from banks:

1	2	3	4	5	6	7	1	2	3	4	5	6	7	1	2	3	4	5
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

Yield/Bonding/PCBs

- See spreadsheet...
 - [boards-yeildtracker.xls](#)
- Missing ORE signals is a common failure of W10 parts
 - For further investigation...

- | <u>Stock</u> (12u+DPW) | |
|------------------------|-------------|
| W8 | 9 |
| W10 | >9 |
| W# | 60 (sealed) |

Outstanding issues

- Per-pixel scan data analysis
 - What spread do we see? (per pixel type)
 - What range of trims are required?
- Would like to run threshold scans while holding pixels in reset?
 - Matt says firmware will support this
 - Paul needs to confirm if software will override settings?
- Check for BANK=0 in raw data
 - Low priority as “cold-columns” now explained
 - But should still be run on all sensors to check data integrity, otherwise would be losing hit data with no knowledge
- Sensor #9 at IC
 - Mods done?
 - Threshold scan ok?
- Marcel will show
 - Row address corruption & per-row masking scans
 -
